CERAMIC ELECTRONIC COMPONENT AND
METHOD OF PRODUCING THE SAME

ABSTRACT OF THE DISCLOSURE

The present invention provides an electronic component provided with the terminal electrode having a three layer structure comprising a first layer, a second layer and a third layer successively formed on each end face of the main electronic component, the second layer being a porous structure to advantageously absorb the stress caused by expansion and shrinkage of the wiring board, thereby preventing the main electronic component from suffering the stress, and the non-porous first layer maintaining good electrical continuity with the inner electrode while the non-porous third layer serving for preventing permeation of the solder liquid along with maintaining good electrical continuity to the outside, thereby preventing the ceramic component from being mechanically damaged due to expansion and shrinkage applied from the wiring board when the ceramic electronic component is packaged on the wiring board.
